Add and maintain threat intelligence locally in Splunk Enterprise Security

Each threat collection has a local lookup file that you can use to manually add threat intelligence.

1. On the Enterprise Security menu bar, select **Configure > Content > Content Management**.
2. Find the local lookup that matches the type of threat indicator you want to add. For example, **Local Certificate intel** to add information about malicious or spoofed certificates.
3. Click the lookup name to edit the lookup.
4. Add indicators to the lookup. Right-click and select **Insert Row Below** to add new rows as needed.
5. (Optional) Type a numeric **Weight** to change the risk score for objects associated with indicators on this threat intelligence source.
6. Click **Save**.

Next step

To add another custom threat source, see [Add threat intelligence to Splunk Enterprise Security](#) and follow the link that matches the source that you want to add.

If you are finished adding threat intelligence sources, see [Verify that you have added threat intelligence successfully in Splunk Enterprise Security](#).
